

X-ray guided core biopsy (stereo)

This leaflet tells you what to expect during an X-ray guided core biopsy of your breast(s).

What is an X-ray guided core biopsy?

An X-ray guided core biopsy is the way in which we take a sample of breast tissue using X-ray to guide us to the area we need. Sometimes, the tissue sample needed is not visible on ultrasound and so we need the X-ray to guide the radiologist (X-ray specialist) to the right area.

Why do I need this test?

This procedure is carried out because there is an area the pathologist (tissue specialist) needs to look at in order to make a diagnosis.

Results

You will get an appointment to return for the results before you leave the clinic. The follow up appointment is usually one week from the date of biopsy and is held in the Breast Screen Unit in Craven Road, unless informed otherwise.

Aftercare

- **Pain:** The local anaesthetic you received to numb the area will wear off after a few hours and your breasts may feel sore and uncomfortable. A mild painkiller, such as Paracetamol/Ibuprofen may be taken to ease any discomfort, so make sure you have a supply at home and that you follow the dosage instructions.
- **The dressing:** The dressing applied should be left on for 48 hours. The dressing is waterproof and you can have a shower after 24 hours but don't scrub over the dressing. After 48-hours, take the dressing off in the shower/bath. If you experience any skin irritation from the dressing, please remove immediately and replace it with another suitable dressing, e.g. large plaster.
- **Bruising:** The amount of bruising after this procedure varies widely. Any bruising around the biopsy area should take one or two weeks to clear up.
- **Infection:** Although we take great care to prevent infection, there is a small possibility the wound may become infected. If there is any pus present, or the skin becomes red or feels hot or swollen, please contact your GP or the Breast Screen Nurse.
- **Bleeding:** In the unlikely event there is a small amount of bleeding, apply firm pressure with a dressing or tissue over the original dressing for five minutes and it should stop. If the bleeding continues, please contact your GP or the Breast Screen Nurse.
- **Exercise:** Rest on the day of the biopsy and avoid any heavy lifting or other heavy jobs. Also, avoid swimming or sport for a couple of days after the biopsy.
- **Bra:** It may be more comfortable to wear a soft non-underwired bra or sports bra for the rest of the day of the procedure.

More information

If you have any concerns or worries related to this procedure, please contact Carolyn Denham, Breast Screen Nurse on 0118 322 8563. Out of normal working hours, please contact your GP.
